

SEATING & TRANSPORT EQUIPMENT

KINDER CHAIR WITH TRAY

FAS Kinder Chairs have a firm, padded vinyl covered back and seat to aid alignment of the pelvis and femurs as well as to provide a symmetrical sitting base. Seat depth is adjustable to assure that the thigh is well supported to prevent undue internal rotation stress on the femoral heads and reduce the effect of tight hamstrings or extensor spasticity on the pelvic and thoracic posture. Removable abduction block at the front of the seat, together with a pelvic belt decrease the tendency for the child to push out of the chair into extension. The Back Angle can be adjusted to maintain vertical alignment of the pelvis and spine. The adjustable Footrest makes it possible to position the hips and knees at 90 degrees which also aids in the decrease of extensor tone of the hips. Additional pelvic stability and femoral alignment can be obtained by adding the optional Pelvic-Femoral Stabilizer with Abductor.

Model SK1, Low Kinder Chair is designed to fit under pre-school tables. The stability of this chair makes it easy for young children to learn to transfer in and out of the chair safely.

Model SK2, High Kinder Chair has longer legs which adjust for use with standard tables. It is ideal for children who have outgrown conventional high chairs but still need the support of an adjustable seat, back and armrests to interact with the family at the table for meals and activity.

Kinder Chair SK1 with Pelvic-femoral Stabilizer.

Kinder Chair SK1 and SK2. SK2 is a high chair. Both come with a tray as standard.
